Okechukwu Joshua Onyedikachi

DevOps Engineer/SRE

onyedikachi0813@gmail.com +234 905 610 5963 LinkedIn

PROFESSIONAL SUMMARY

DevOps Engineer / SRE with hands-on experience across FinTech, EdTech, and startup environments, working in concurrent contract roles spanning CI/CD, Kubernetes, and cloud infrastructure on AWS and Azure. Builds and operates production-discipline systems end-to-end: GitOps delivery pipelines, observability with defined SLOs and error budgets, and infrastructure as code with Terraform/Terragrunt. Practices security-first delivery (DevSecOps gates, secret scanning, policy-as-code) and documents rigorously, from release runbooks to blameless postmortems.

Professional Experience

FIRST BANK OF NIGERIA, *DevOps Engineer* 09/2026 – Present | Lagos, Nigeria

- Building end-to-end release automation on Azure DevOps, covering deployment pipelines and automated unit, integration, security, and smoke testing across environments
- Defined the approval gates and rollback procedures that production releases follow, so promotions are consistent and reversible.

Odera Training Academy, *Platform Engineer* (*Contract, Concurrent*) 12/2025 – 06/2026 | Remote

- Designed a multi-region web application to deliver lessons and exercises to an international audience.
- Automating student server setup with Terraform and scripts; currently testing with a pilot group.
- Developing CLI tools and documentation to help learners configure SSH, firewalls, and runtimes on remote servers.

FIRST BANK OF NIGERIA, *DevOps Engineer*(*Contract, Concurrent*) 02/2025 – 01/2026 | Lagos, Nigeria

- Led weekly DevSecOps training sessions with live Q&A on container security scanning and static analysis for technical teams; built the roadmap that added security gates across dev, staging, and testing pipelines.
- Authored comprehensive release workflow documentation on approval gates, environment promotion, and rollback procedures, which became the production release standard.

TECHWINGS GLOBAL LLC, *DevOps Engineer* (*Contract, Concurrent*) 08/2024 – 07/2025 | Remote

- Implemented auto-scaling and capacity planning for Python microservices on DigitalOcean, achieving zero-downtime deployments.
- Fine-tuned Redis and worker configurations to resolve throughput issues without adding infrastructure or cost.
- Reduced test and production environment setup time by 60% by replacing manual provisioning with Terraform, while auditing and resolving state drift across load balancers and compute nodes.

SHUTTLE9JA, *Junior DevOps Engineer*(*Internship/Training Program*) 12/2022 – 04/2024 | Ogun, Nigeria

- Developed the team's first CI/CD pipeline with GitLab CI, automating SSH deployments to reduce errors and accelerate delivery.
- Deployed Prometheus and Grafana, shifting from reactive monitoring to real-time system health visibility.
- Prevented crash cycles during peak load by enforcing CPU and memory limits on Docker containers.

Technical Skills

Containerization — Docker, Kubernetes (Cluster Architecture, CRDs, Operators, kubeadm), Helm.

CI/CD & Automation — Azure DevOps (YAML Pipelines), GitHub Actions, Jenkins, GitLab CI, ArgoCD, Git.

Cloud Platforms — AWS (EKS, ECS, Lambda, IAM, VPC, CloudWatch, X-Ray, GuardDuty, Cost Explorer), Azure (DevOps, Monitor), DigitalOcean.

Scripting & Automation — Python (Automation/Tooling, CLI design with Click), Go, Bash, PowerShell.

Observability & SRE — Prometheus, Grafana, Loki, kube-state-metrics, Azure Monitor, CA UIM, ManageEngine, SLIs/SLOs, error budgets, chaos engineering (LitmusChaos).

Infrastructure as Code — Terraform (Modules, Remote State, State Locking), Terragrunt, Ansible, Bash Scripting.

Security & Compliance — Trivy, Gitleaks, Checkov, Prowler, container/image scanning, DevSecOps.

Practices — GitOps, DevSecOps, Incident Management, Blameless Post-Mortems, Cost Optimization.

Platform Engineering — Backstage (software catalog, golden-path templates), self-service infrastructure, internal developer platforms.

Projects

Kubernetes, Cloud & SRE Engineering Program, *Personal project, self-directed* 05/2026 – Present

- Built a production-grade Kubernetes cluster from scratch (kubeadm on Kind) and implemented HPA/VPA, PodDisruptionBudgets, and rolling, blue-green, and canary deployment strategies.
- Deployed a full observability stack (Prometheus, Grafana, Loki, kube-state-metrics) and integrated Trivy image scanning into the deployment workflow.
- Built a GitOps delivery platform on ArgoCD with pull-request-based multi-environment promotion, plus a Backstage internal developer portal with a software catalog and golden-path templates.
- Modularized Terraform using Terragrunt with remote state and state locking, added Checkov policy scanning and Gitleaks secret scanning to every commit.
- Deployed the platform to AWS (EKS/ECS) with least-privilege IAM and VPC design; ran Prowler against the environment and remediated findings across IAM, S3, and networking.

- Implemented CloudWatch and X-Ray observability, event-driven components with SQS/EventBridge, and produced architecture decision records (ADRs) for key design choices.
- Defined SLIs/SLOs and error budgets, ran chaos experiments with LitmusChaos, and simulated incidents with blameless post-mortems and runbook documentation.

Self-Hosted Infrastructure Lab, *Personal project, self-directed* 03/2026 – Present

- Architected and operate a GitOps-managed platform running 21 containerized services on constrained hardware (2-core i3-3220, 3.7 GB RAM) at $0/month, with per-container resource limits enforced to prevent contention on shared memory.
- Defined 3 SLOs with formal error budgets (99.5% gateway availability, 99% media responsiveness, 99% pipeline health) and enforced a budget policy requiring a written postmortem before any new feature ships once 50% of a budget is burned.
- Built a pull-based GitOps pipeline (systemd timer polling origin every 5 min, docker compose up -d on change) instead of a self-hosted CI runner, removing all inbound reachability from GitHub into the network.
- Diagnosed a monitoring blind spot where node-exporter and cadvisor had never been deployed and Prometheus's own self-scrape had silently failed; fixed all four gaps and restored coverage the error-budget alerts actually depend on.
- Recovered from a 15-hour sudo lockout after a credential rotation using the pipeline's own break-glass mechanism, then fixed a latent bug the recovery exposed that would have broken every future deployment.
- Reduced the public attack surface to one allowlisted route (status page via Tailscale Funnel); Grafana, Prometheus, Portainer, and Vaultwarden stay LAN-only.

Education

B.Sc. Computer Science (2024), *Babcock University*

Certificates

Oracle Cloud Infrastructure (OCI) DevOps Professional (2023) • Oracle Cloud Infrastructure AI Foundations Associate (2025) • National Youth Service Corps (NYSC): Discharge Certificate (Completed 2026)
